You are a Product Analyst on the Uber Eats team investigating delivery partner performance....

Question 1: What is the percentage of orders delivered on time in January 2024? Consider an order on time if its `actual_delivery_time` is less than or equal to its `expected_delivery_time`. This will help us assess overall tracking precision.

```
SELECT
    COUNT(CASE
        WHEN actual_delivery_time <= expected_delivery_time THEN 1
    END) * 100.0 / COUNT(*) AS on_time_delivery_percentage
FROM fct_orders
WHERE order_date >= '2024-01-01'
    AND order_date < '2024-02-01';
```

Question 2: List the top 5 delivery partners in January 2024 ranked by the highest percentage of on-time deliveries. Use the `delivery_partner_name` field from the records. This will help us identify which partners perform best.

```
SELECT
    delivery_partner_name,
    COUNT(CASE
        WHEN actual_delivery_time <= expected_delivery_time THEN 1
    END) * 100.0 / COUNT(*) AS on_time_delivery_percentage
FROM fct_orders
WHERE order_date >= '2024-01-01'
    AND order_date < '2024-02-01'
GROUP BY delivery_partner_name
ORDER BY on_time_delivery_percentage DESC
LIMIT 5;
```

Question 3: Identify the delivery partner(s) in January 2024 whose on-time delivery percentage is below 50%. Return their partner names in uppercase. We need to work with these delivery partners to improve their on-time delivery rates.

```
SELECT
    UPPER(delivery_partner_name) AS delivery_partner_name,
    COUNT(CASE
        WHEN actual_delivery_time <= expected_delivery_time THEN 1
    END) * 100.0 / COUNT(*) AS on_time_delivery_percentage
FROM fct_orders
WHERE order_date >= '2024-01-01'
    AND order_date < '2024-02-01'
GROUP BY delivery_partner_name
HAVING COUNT(CASE
    WHEN actual_delivery_time <= expected_delivery_time THEN 1
END) * 100.0 / COUNT(*) < 50
ORDER BY on_time_delivery_percentage;
```
